Idea

One of the offline events that will be fun as well as challenging and interesting for the participant is a quiz. This quiz will be based on the participant's knowledge of parallel computing technologies and their use in the industry.

In this event, we can have a team of two that can participate and then we can Have multiple rounds to select the winning team. Questions that can be asked will be purely based on parallel computing technologies.

Vision

A quiz is indeed very trivial but parallel computing seems like a mystery and a black box to those who do not have any knowledge about it so, having a quiz based on this will motivate students to learn more about this field and get to learn more and more about the terminologies and technical terms of this field as we know that the LLM is the new fire in the today's market and they are nothing without parallel processing and computations.

Venue

We can have this event organized based on the number of participants with few participants we can have this event in classrooms as well but with many participants we can do this in the Orion.

Budget

The budget will be the prizes that we will distribute to the winners as well as the runner-ups of the event.

People Needed

To organize this event main thing is the set of questionnaires that is to be asked and this can be done by only those individuals of the club who have experience in parallel computing and are aware of techniques and how their power can be harnessed. Individuals who have prior experience in ML and DL fields or any experience in the workings of GPU usage on Kaggle or Collab will be able to contribute to organizing this event.

Publicity

As much as I am aware of the publicity techniques used by the club are using social handles as well as spreading the message through the college groups so, that everyone is aware of the event as well as using posters and pamphlets to spread the work are some of the techniques that can be used for the publicity.
